
CURSO DE LECTURA COMPRENSIVA DE TEXTOS EN INGLÉS
PROGRAMA DE IDIOMA INGLÉS - UNIVERSIDAD NACIONAL DEL SUR
NIVEL II – MODELO 2do Parcial

Apellido y nombre:

LU:

Carrera:

Comisión:

From 1990 to the present, cities around the world have been changing rapidly. The use of digital technology in city management has given rise to what we now call “smart cities.” These are cities that use data, sensors, and computer systems to make urban life easier and more efficient. The goal is to improve transportation, energy use, health services, and even public safety.

The first results of this technological revolution were impressive. Traffic lights that change automatically reduced traffic jams. Smart energy systems helped to save electricity and water. Hospitals began using digital records, and emergency services arrived faster thanks to GPS systems. Many citizens felt that smart cities were the future.

However, after several years, some problems have become visible. Smart cities depend heavily on technology, and that technology is expensive. Installing cameras, sensors, and communication systems requires large investments. Not all cities or countries can afford these costs. As a result, the gap between rich and poor regions has grown.

Another concern is privacy. In smart cities, cameras and sensors collect information about citizens’ movements, habits, and even health. Although this data helps governments plan better services, many people worry about how their personal information is used. Cybersecurity experts also warn that hackers could attack these systems, causing serious damage.

Environmental issues are also part of the discussion. Smart technologies can save energy, but they also require electronic devices that produce waste and pollution when they are manufactured or thrown away. Engineers and architects are now trying to design systems that are more sustainable and easier to recycle.

Finally, the creation of smart cities has generated new social debates. Some people think that technology will solve most urban problems, while others argue that social policies and education are equally important. In any case, cities around the world are learning that becoming “smart” is not only a matter of technology, but also of responsibility and equality.

1. Indicar si las siguientes oraciones son verdaderas o falsas. En el caso de las falsas, redactar la versión verdadera (se evaluarán ambas actividades: indicar V/F y corrección).

- a. Las primeras mejoras de las ciudades inteligentes incluyeron un uso más rápido y eficiente de los servicios de emergencia.
- b. Implementar tecnologías inteligentes resulta muy costoso para algunas ciudades o países.
- c. Los sistemas inteligentes siempre garantizan la protección total de los datos personales de los ciudadanos.

- d. Los dispositivos electrónicos utilizados en las ciudades inteligentes son completamente ecológicos.
- e. Algunas personas creen que la tecnología debe complementarse con otras políticas urbanas.

2. Responder las siguientes preguntas en español.

- a) ¿Qué beneficios concretos produjeron los primeros sistemas tecnológicos de las ciudades inteligentes?
.....
.....
- b) ¿De qué manera se puede reducir el impacto ambiental de las tecnologías inteligentes?
.....
.....

3. En el texto predominan dos patrones de organización. Indicar cuáles son y transcribir tres señales (palabras o frases) para cada patrón:

Patrón 1:	Patrón 2:
Señales: 1.	Señales: 1.
2.	2.
3.	3.

4. Señalar la opción que mejor expresa la idea principal de todo el texto y a continuación expresarla en español.

- a. Smart cities use technology mainly to modernize basic urban services.
- b. Smart cities offer advantages but also bring economic, social, and environmental challenges.
- c. Smart cities increase surveillance but decrease public participation.
- d. Smart cities eliminate the need for traditional public policies.

Idea principal:

.....

5. Proponer un título en español para el texto.

.....
